The electric car-maker has been able to gain quite a bit of attention through its work on AC powertrain technology, including motors, inverters and controllers. However, when it comes to battery cells, the startup has only made a single battery cell in its corporate history. This week, at the Beijing International Electric Vehicle Symposium and Exhibition (BIEVS), the company announced a new long-term partnership with BYD. This will enable AC Motors to continue to develop batteries, along with its core competencies of AC motor control and powertrain systems. For AC Motors, the company's core competency and strength has always been the development of AC motor powertrain systems. The company was able to create some pretty impressive powertrain systems, including one that was part of the second generation of the Tesla Model S. AC Motors also built powertrain systems for the General Motors Bolt EV, along with a lot of work on several other EV products. The company's engineering talent is quite apparent from its EV products. Unfortunately, while the company has managed to gain quite a bit of attention for its powertrain solutions, it has been largely quiet when it comes to battery cells. In fact, the company has never made a battery cell or cell pack in its corporate history, and the company was able to build only a single battery cell to take part in a test of a1d647c40b

Moxibustion is a common traditional technique in many Asian countries. Recently, rotational moxibustion has been demonstrated to be an effective treatment for some chronic conditions. This review summarizes the current studies on the efficacy and safety of rotational moxibustion for chronic conditions. The literature was retrieved by searching various databases, including MEDLINE, EMBASE, and the Cochrane Library, for the period from 2000 to December 2008. Handsearching was performed to identify additional studies. This review demonstrates that rotational moxibustion is effective for relieving pain in patients with rheumatoid arthritis and superficial external tinea and for the treatment of vertigo. This review also indicates that rotational moxibustion is effective for hemostasis, increasing the capillary permeability, inhibiting platelet aggregation, and increasing the release of inflammatory mediators. In addition, no reports of serious adverse events have been identified. The results of our review support the efficacy and safety of rotational moxibustion in the treatment of certain chronic conditions. Further research is required to confirm the efficacy and safety of this treatment.History of Notable Immigration Events to the U.S. from Georgia Get the latest on history of Georgia and immigration in America.
