All that it does is run the programs that I have told it to run. It does not make any attempt to scan and will not scan my motherboard for protection against Intel, or any other hardware manufacturer's software. What a waste of $9.00! I expected more from such a product!Q: Is there a way to get the direction from the camera to the light using its parameters? Is there a way to calculate the direction from the camera to the light to use in scene graph for calculating Z-component of light? I know that I can use both of them: direction from the camera to the light in all three axes the position of the camera and the light But they don't work as I expected. There is a formula for calculating light Z-component directly from the camera and the light, but that's a post-processing. I found a solution, but it looks clumsy. var direction = Vector3.Direction(camera.transform.TransformDirection(Vector3.forward) * camera.transform.position.x, camera.transform.TransformDirection(Vector3.forward) * camera.transform.position.y, camera.transform.TransformDirection(Vector3.forward) * camera.transform.position.z); That's two for loops (x, y, z), but I need just one because the scene's matrix needs three components. A: To calculate Light Z-component you can subtract the Light's position and the camera's position. For lights in the SceneKit viewport you can take advantage of the zPosition property, then for lights in the viewport node tree you can use the node.worldTransform.multiplyByScalar(1/z).z OAKLAND, 09e8f5149f
