1. Field of the Invention This invention relates to a process for the production of a hollow glass fiber. More specifically, this invention relates to a process for the production of a hollow glass fiber having an improved strength, which is formed from molten glass. This invention also relates to a hollow glass fiber obtained by the process. 2. Description of the Prior Art Heretofore, it has been proposed to form a hollow fiber by blowing or drawing a molten glass. However, the thus formed hollow glass fiber is not satisfactory in strength, and therefore, is not suitable as the reinforcing material in a resinous composition. In this connection, it has also been proposed to produce a hollow glass fiber by enclosing molten glass in a hollow fiber formed from molten glass, and drawing or expanding the enclosed molten glass. As to the process in which the hollow glass fiber is formed from molten glass and subsequently a hollow glass fiber enclosed with the molten glass is formed, there are some problems to be solved. It is a very difficult to enclose the molten glass in the hollow fiber formed from the molten glass and, in case of breakage of a hollow glass fiber, the hollow glass is scattered and, therefore, the hollow glass fiber enclosed with the molten glass becomes extremely brittle. Further, there is another problem that, in case the hollow glass fiber enclosed with the molten glass is drawn, the hollow glass fiber may be brought into contact with the inner wall of a vessel or the hollow glass fiber enclosed with the molten glass may be pressed on the inner wall of the vessel by the weight of the molten glass enclosed in the hollow glass fiber. Thus, the enclosed molten glass is liable to be broken and, therefore, the hollow glass fiber enclosed with the molten glass may be broken during the production of the hollow glass fiber. Further, in case of breaking of the hollow glass fiber, the broken fragments may be scattered and may be mixed with the molten glass. The thus obtained mixture may be once again enclosed with the molten glass to form a new hollow glass fiber. Thus, the obtained fiber may be repeatedly broken and re-blended with the molten glass, with the result that the hollow glass fiber may be broken again when it is used. Thus, the hollow glass fiber may be unreasonably deteriorated in strength.

British Rail Class E1 British Rail Class E1 is a classification used by Network Rail for two experimental electric locomotives used on the West Coast Main Line in Great Britain between 2007 and 2013. These locomotives are electrically powered and meet the criteria laid down by the Driver Only Operation (DOO) program; that is, they are allowed to be run by just the driver as a standing locomotive (that is without any on-board rail crew). The first locomotive to enter service under this class was Class E3 No. 100082 from Siemens. At this time Class E1 was the only class available to operate as a DOO locomotive, and subsequent locomotives of Class E1 have carried the letter prefix E to signify their DOO status. All of the fleet are now withdrawn and have been replaced by Class 800/801 EMU stock. Overview The locomotives were built by Siemens (including the E8) and General Electric. As of February 2011, the fleet comprised seven locomotives, all of which were in use, although class E1 No. 100012 was in storage. All have a driving cab that meets the DOO requirement. Power units are enclosed in an environmentally friendly form of containerised technology. The locomotives are electrically powered via a three-phase asynchronous AC traction motor powered at via a three-phase DC link, delivering (This delivery was a high estimate to meet the DOO speed capability) powered at from the transverse collection system. The newly delivered locomotive (E3 No. 100082), which entered service in 2010 was fitted with a very large () front end and a "dip-off" dipstick indicator arrangement. The locomotives have cabs which comfortably seat eight people, but can accommodate up to ten; seven seats were fitted on the locomotives under testing at Siemens, with the addition of one seat in a "flagmen" cab at the front of the locomotive. History The first four locomotives entered service between 2007 and 2009. The first two were delivered to Marfleet depot in Tilbury; they were later joined by the next two locomotives, also built by Siemens. The first four locomotives were delivered in 2007 to the Eastleigh depot for testing. By April 2009, the first four locomotives were operational and carried the letter 'E' to signify DOO testing.
